Pleveli in bolezni lahko močno zmanjšajo pridelek žit in kakovost žitnih zrn. Če želimo doseči čim večji in čim bolj kakovosten pridelek, moramo takoj po setvi žit začeti z zatiranjem plevelov. Velikokrat pa vremenske razmere ne omogočajo takojšnjo uporabo herbicidov, zato je potrebno škropljenje v kasnejših razvojnih fazah žit. Za ta škropljenja uporabimo herbicide Hussar in Sekator, ki vsebujeta nove aktivne učinkovine in imata nov način delovanja. Hussar odlično zatira vse pomembne enoletne širokolistne in ozkolistne plevela ter nekatere večletne širokolistne plevela v ozimni in jari pšenici ter ozimnem in jarem ječmenu. Sekator odlično zatira enoletne širokolistne in nekatere ozkolistne plevela ter nekatere večletne širokolistne plevela v ozimni in jari pšenici ter ozimnem in jarem ječmenu.

Različne bolezni žit močno ovirajo rast, razvoj in pridelek žit ter vplivajo na slabšo kakovost pridelanega zrnja. Fungicid Flamenco zatira listne pegavosti, pepelasto plesen, rje in ječmenov listni ožig na žitih. Pripravek ima v svoji sestavi poleg aktivne učinkovine dodatno snov, ki močno pospeši prehajanje aktivne učinkovine iz površine lista v notranjost lista zato je mnogo bolj učinkovit kot sorodni fungicidi.

ABSTRACT

HUSSAR, SEKATOR AND FLAMENCO - NEW PHYTOPHARMACEUTICAL PRODUCTS WITH NEW MODE OF ACTION TO CONTROL WEEDS AND DISEASES IN CEREALS

The yield of cereals and the quality of cereal grains could be severely reduced by weeds and diseases.

For high and quality yield it is very important to start immediately after sowing to control the weeds. The weather conditions are not seldom bad and the herbicides could not be sprayed at that time but later in the season when the cereals are in more developed growth stages. Hussar and Sekator can be used when the cereals are in more developed growth stages. Both products have new active ingredient with new mode of action. Hussar is excellent to control all important annual broadleaf and grass weeds and some of perennial broadleaf weeds in winter and summer wheat and winter and summer barley. Sekator is excellent to control annual broadleaf and some grass weeds and some of perennial broadleaf weeds in winter and summer wheat and winter and summer barley. The growth, development, yield and quality of cereals is highly reduced by different diseases. Fungicide Flamenco controls the following diseases on cereals: *Septoria* spp., *Puccinia* spp., *Erysiphe graminis* and *Rhynchosporium secalis*. The product consists of active ingredient and additional compound which enhance the uptake of a.i. from the surface of the leaf into the leaf. This is a reason that Flamenco is much more effective to control these diseases as the similar fungicides which are on the market.
